## **CLAIMS**

1. A one touch-type container stopper, comprising:

a hermetically sealing part having a plurality of first supporting protrusions at a lower end thereof, the first supporting protrusions being formed to protrude inwardly such that they are elastically supported along an outer peripheral surface of a mouth of the container, the sealing part being fitted around the mouth to seal the container; and

a cover part having a hinge part formed integrally with and extending from the first supporting protrusions and then bent, and a plurality of second supporting protrusions at a lower end thereof to protrude inwardly therefrom, the cover part being positioned outside of the sealing part,

wherein the second supporting protrusions are connected to one another through a band member.

15 2. A one touch-type container stopper, comprising:

a hermetically sealing part having a plurality of first supporting protrusions at a lower end thereof, the first supporting protrusions being formed to protrude inwardly such that they are elastically supported along an outer peripheral surface of a mouth of the container, the sealing part being fitted around the mouth to seal the container; and

a cover part having a hinge part formed integrally with and extending from the first supporting protrusions and then bent, and a second supporting protrusion at a lower end thereof to protrude inwardly therefrom, the cover part being positioned outside of the sealing part.

- 25 3. The one touch-type container stopper as claimed in claim 1 or 2, wherein the height of the cover part is larger than that of the sealing part.
  - 4. The one touch-type container stopper as claimed in claim 1 or 2, wherein a friction member is further provided between the sealing part and the cover part.

- 5. The one touch-type container stopper as claimed in claim 1 or 2, wherein the hinge part has an inclination such that the sealing part side is at a level higher than that of the cover part side.
- 5 6. The one touch-type container stopper as claimed in claim 1 or 2, wherein a cover member is further provided at a lower end of the cover part to surround the second supporting protrusions or protrusion.

## 7. A container, comprising:

25

30

a body portion of the container having a first catching projection at an upper end of a mouth thereof, and a second catching projection formed below the first catching projection, the second catching projection having an outer diameter larger than that of the first catching projection; and

a stopper having a hermetically sealing part fitted around the mouth to seal the container, and a cover part positioned outside of the sealing part,

wherein the sealing part is provided with a plurality of first supporting protrusions at a lower end thereof to protrude inwardly such that they are caught and elastically supported by the first catching projection, and

the cover part is provided with a hinge part formed integrally with and extending from the first supporting protrusions and then bent, and a plurality of second supporting protrusions at a lower end thereof to protrude inwardly therefrom, the second supporting protrusions being connected to one another through a band member.

## 8: A container, comprising:

a body portion of the container having a first catching projection at an upper end of a mouth thereof, and a second catching projection formed below the first catching projection, the second catching projection having an outer diameter larger than that of the first catching projection; and

a stopper having a hermetically sealing part fitted around the mouth to seal the container, and a cover part positioned outside of the sealing part,

WO 2005/009852 PCT/KR2004/001850

14

wherein the sealing part is provided with a plurality of first supporting protrusions at a lower end thereof to protrude inwardly such that they are caught and elastically supported by the first catching projection, and

the cover part is provided with a hinge part formed integrally with and extending
from the first supporting protrusions and then bent, and a second supporting protrusion at a
lower end thereof to protrude inwardly therefrom.

9. The container as claimed in claim 7 or 8, wherein a hermetically sealing member is further provided between the mouth of the body portion of the container and the sealing part.
